

Stainless Steel Urinals Care Maintenance & Cleaning

Looking After Your Stainless Steel Urinals

After Installation of the Stainless Steel Urinal:

After installation of the stainless steel urinal the whole urinal should be thoroughly cleaned and washed down with a mild soap / detergent solution and water. This will remove any debris that has been left on the urinal during the installation process. Deposits can be left on the urinal which will discolour from items such as: steel nails, screws, paint tins, tools, grinding deposits etc.

Routine Care and Maintenance of Stainless Steel Urinals:

Stainless steel urinals like any other product require routine cleaning.

Stainless steel urinals should be cleaned with a mild soap or detergent solution and water. A regular wipe down with a sponge or cloth with the mild soap / detergent solution will prevent the build up of dirt and deposits and keep the urinal in good condition. Rinse with clean water afterwards.

Regular weekly cleaning should be sufficient.

Cleaning of Stubborn Stains on Stainless Steel Urinals:

If stubborn stains and deposits have been allowed to build up then a cream cleanser that is suitable for use on stainless steel can be used. A nylon kitchen pad or brush can also be used to remove built up dirt and deposits, again use with the mild soap / detergent solution.

Bleach:

Bleach or any bleach based product or products containing sodium hypochlorite should never be used on stainless steel products. If this is used on or accidentally spilt on the stainless steel it will need to be quickly cleaned and rinsed off before irreparable damage is done to the stainless steel.
